

HEMAVIEW (LIVE BLOOD) TEST ON 360 MIST (ZORBMAX)

From: Margaret Shepley

“absolutely incredible” (practitioner)

I just received the report of my **HemaView Live Blood Test** that I did on **13 July 2010** by **DH-Natural Medicine Clinic** in Sydney, Australia.

On the following pages you can see before and after photos and the analysis by the qualified health practitioner.

Please take into consideration that **I am 72 years old**.

I did not tell her (the practitioner) anything about the product that I wanted to test before we started.

The BEFORE Test

The before test was performed as per normal procedure to gain a confirmation of a “baseline” or “control” state.

She reviewed the test and found a number of problems...

My red blood cells had formed long chains (**rouleaux**) and there were signs of inflammation.

I have had **Osteoarthritis** for years so I was sure there would be plenty of **inflammation** in my system. **Candida** infestation and acidity were also noted.

A large **aggregation of platelets** was present as well as **protoplasts**.

The AFTER Test

I sprayed 4 sprays of 360 Mist under my tongue.

We **waited 2 minutes**... and took another blood sample for analysis.

She just said WOW and called her husband in from the shop to show him what happened in two minutes.

She could not find large platelet aggregation or large protoplasts after the 360 MIST test. The platelet aggregation was small.

She was not sure if the spray would reduce the platelet aggregation even though there were only small ones in the after test.

She did say it would be a good idea to repeat the test after using 360 Mist for a while to look for any longer term improvements.

Conclusion

When I left she said **“absolutely incredible”** and she is going to have a look at the **360 Mist** product info.

Please review the **before and after photos** and analysis on the next few pages. If you know anything about live blood then your decision should be obvious.

blood before taking 360 mist

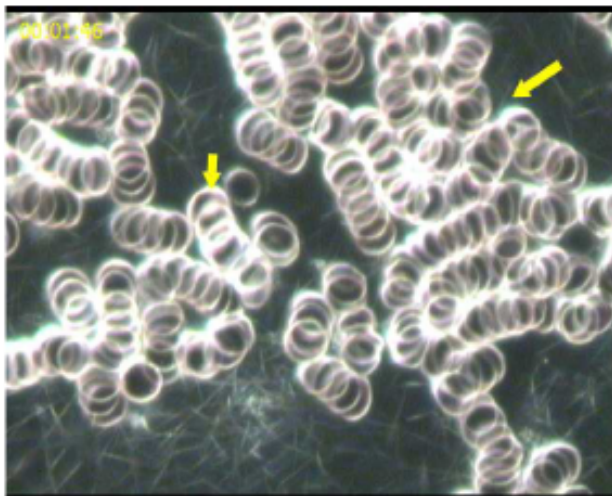

Parameter: **Rouleaux**

Grade: **medium**

Your red blood cells have formed long chains due to being coated in sticky proteins. This is a sign that there may be inflammation happening in your body. This inflammation can be associated with infection, allergy, toxicity, poor digestion or unhealthy dietary choices.

blood before taking 360 mist

Parameter: **Rouleaux**

Grade: **high**

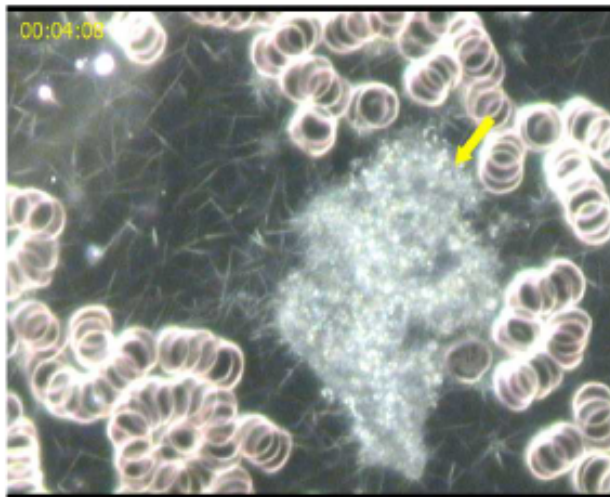

Your red blood cells have formed long chains due to being coated in sticky proteins. This is a sign that there may be inflammation happening in your body. This inflammation can be associated with infection, allergy, toxicity, poor digestion or unhealthy dietary choices.

Hemaview Screening Report

blood before 360 mist- platelets aggregation

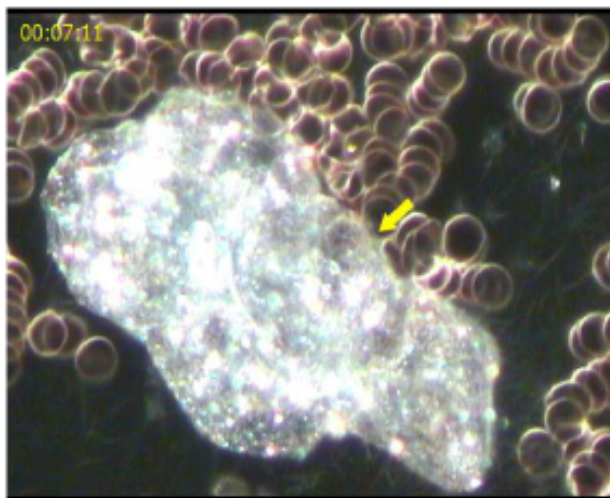

Parameter: Platelet Aggregation

Grade: high

Platelets are responsible for blood clotting. Various lifestyle choices (such as smoking or eating fatty foods) and disease states may make platelets stickier, resulting in platelet aggregations. Large aggregations can be a sign of an increased tendency to blood clotting.

blood before 360 mist-protoplast

Parameter: Protoplasts

Grade: medium

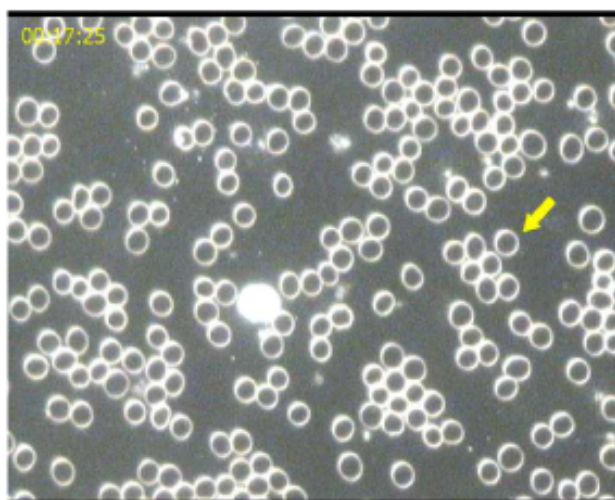

Protoplasts are large irregular clear masses with smooth edges. It is not known for certain what causes these to form, but it is possible they are a sign of poor digestion, infection or inflammation.

Hemaview Screening Report

blood 2min after taking 360 mist

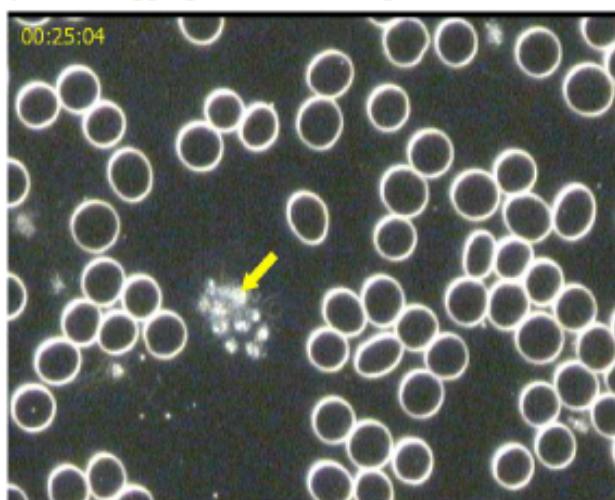

Parameter: Healthy blood

Grade:

In healthy blood, red blood cell are well separated, repelling each other due to being negatively charged. 360 mist has caused RBC to repel each other.

platelets aggregation-after taking 360 mist

Parameter: Platelet Aggregation

Grade: low

Platelets are responsible for blood clotting. Various lifestyle choices (such as smoking or eating fatty foods) and disease states may make platelets stickier, resulting in platelet aggregations. Large aggregations can be a sign of an increased tendency to blood clotting. It cannot be concluded that 360 mist resolved platelets.
